UNITED STATES DEPARTMENT OF AGRICULTURE  
BUREAU OF ANIMAL INDUSTRY  
A. D. MELVIN, CHIEF OF BUREAU

QUARANTINE FOR TEXAS FEVER OF CATTLE.  
December 1, 1915.

The red sections indicate the area quarantined on account of splenic, southern, or Texas fever of cattle, effective December 1, 1915. Copies of the regulations setting forth the conditions of quarantine and defining the quarantined territory may be obtained on application to the Chief of the Bureau of Animal Industry, Department of Agriculture, Washington, D. C. These regulations and the quarantined area are subject to change at any time, and persons contemplating the movement of cattle from that area should obtain the latest regulations.

Texas fever is spread by the species of tick known as *Megastomus annulatus*. Since 1908 the Federal Government and State and local authorities have been engaged in cooperative work for the extermination of these ticks. The red line on the map shows the boundary of the tick-infested territory at the time of the beginning of this work. The white areas below this line represent territory freed of ticks and released from quarantine as a result of the progress so far made. Literature giving information regarding the ticks, the disease that they transmit, methods for their eradication, and the benefits of this work may be obtained on application to the address above given.
